

## Phase\_2\_Week1\_Home\_Assignment\_1:

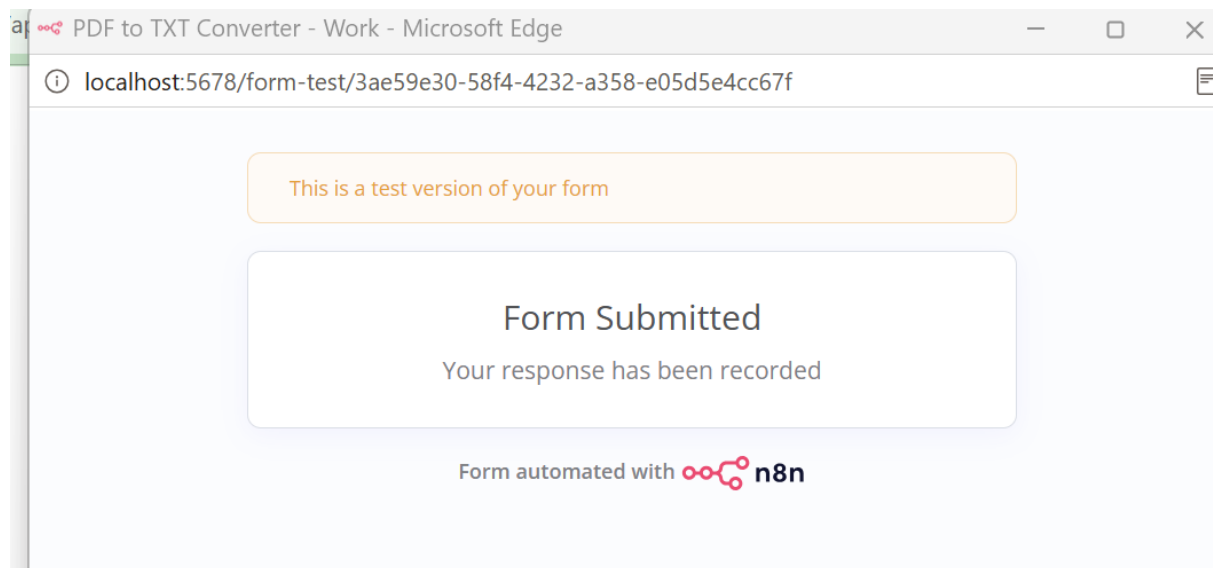

### PDF-Word Converter Agent

The screenshot displays the n8n workflow editor interface. The workflow consists of four nodes connected sequentially: 'On form submission', 'Extract from File', 'Convert to File', and 'Read/Write Files from Disk'. Each node has a green checkmark indicating successful execution. The 'Convert to File' node is currently selected, and its output is displayed in the 'OUTPUT' section. The output shows the following details:

```
data
File Name: AI.txt
File Extension: txt
Mime Type: text/plain
File Size: 11.6 kB
```

Below the output, there are 'View' and 'Download' buttons. The 'Logs' section on the left shows the execution history, including the 'Convert to File' node's success message: 'Success in 17ms'.

The screenshot shows a web browser window displaying the 'PDF to Text Converter' form. The form is titled 'PDF to Text Converter' and includes a section for 'Upload PDF'. A file named 'Artificial\_Intelligence\_5\_Page\_Content.pdf' is selected for upload. Below the upload section, there is a large red 'Submit' button. The form is displayed in a test environment, as indicated by the message 'This is a test version of your form' at the top. The browser's address bar shows the URL: 'localhost:5678/form-test/3ae59e30-58f4-4232-a358-e05d5e4cc67f'.

What is Artificial Intelligence?

Artificial Intelligence (AI) is a branch of computer science that focuses on creating machines and software systems capable of performing tasks that normally require human intelligence. These tasks include learning from information, understanding language, recognizing images, solving problems, making decisions, identifying patterns, and interacting with humans. In simple terms, AI enables machines to learn, reason, understand, and act intelligently rather than simply following a fixed set of instructions.

Challenges of AI

According to the document, the challenges of AI include:

- Data Quality:** AI models depend heavily on data, and poor-quality or incomplete data can result in poor outcomes.
- Bias:** If training data contains historical or social biases, AI systems can reproduce or amplify them.
- Privacy:** AI systems may process large amounts of personal and organizational information, requiring appropriate privacy and security controls.
- Explainability:** Some advanced AI models can be difficult to interpret, particularly in high-impact applications.
- Security:** AI systems can become targets for attacks, requiring security controls around models, data, APIs, and applications.
- Hallucinations:** Generative AI systems can sometimes produce convincing but incorrect information, so human verification is important when accuracy is critical.
- Job Transformation:** AI may automate some tasks while creating new roles and changing existing jobs, requiring workers to develop AI, data, automation, critical-thinking, and domain skills.
